

COMPARATIVE ANALYSIS OF GOOGLE EARTH DERIVED ELEVATION WITH IN-SITU TOTAL STATION METHOD FOR ENGINEERING CONSTRUCTIONS

Njike CHIGBU¹²; Maduabughichi OKEZIE¹; Ikenna Donald ARUNGWA² & Chima, O. Ogba²

"Geospatial Information for a Smarter Life and Environmental Resilience"

INTRODUCTION

- Physical & Infrastructural Development compulsorily require:
 - Information about the Earth's topography
 - Height/Elevation of the bare earth
- Such data is used for construction of:
 - Road, Rail, Bridges, Dams etc
- And other scientific studies

INTRODUCTION (Cont'd)

- Google Earth (G.E.) data offers an alternative amidst other satellite derived elevations sources
- G.E. data:
 - Easy to access
 - Readily available
 - May replace traditional methods of height determination measurement (levelling); with improved accuracy.

"Geospatial Information for a Smarter Life and Environmental Resilience"

INTRODUCTION (Cont'd)

Relevant questions by users and potential users

- What are the size of errors inherent in the data?
 - Globally
 - Locally (Aba, Nigeria)
- How useful is G.E. height ?
- To what extent can G.E. height be used the given the level of error in it?

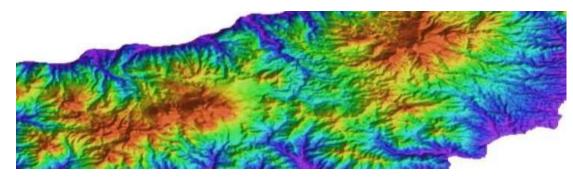

INTRODUCTION (MOTIVATION)

- No report of the global accuracy of G. E. elevation available in public domain
- Only one research so far conducted in Nigeria (Richard & Ogba, 2017)
 - Focused on the morphometric potential without assessing the altimetric quality of G.E. data.

"Geospatial Information for a Smarter Life and Environmental Resilience"

Materials & Methods (Area of Study)

•The study area is at Aba metropolis in Abia State Nigeria

•A low-lying land south-East of

•Nigeria located between: •7°23'41.99" - 7°27'32.85"E •5°09'11.49"- 5°11'34.82"N

"Geospatial Information for a Smarter Life and Environmental Resilience"

Materials & Methods (Tools)

| S/No | Software | Remark |
|------|---------------------|--|
| 1 | ESRI ArcGIS 10.5 | Used for plotting and conversion of points to KML format |
| 2 | SPSS version 23 | Used for statistical analysis |
| 3 | TCX | For extraction and update of height of points |
| 4 | Google Earth Pro | Platform for obtaining G.E. elevation data |
| 5 | Microsoft Excel | For data organization and profile plotting |

FIG FIG WORKING WEEK 2019 2-26 April, Hanoi, Vietnam "Geospatial Information for a Smarter Life and Environmental Resilience"

Materials & Methods (Data)

• Longitudinal Profile of a road

• Extracted equivalent from G. E. using TCX

"Geospatial Information for a Smarter Life and Environmental Resilience"

Materials & Methods Accuracy & Similarity indicators

- Accuracy indicators
 - Mean Error (ME)
 - Root Mean Square Error (RMSE)
 - Standard Deviation (Std Dev)
 - Mean Absolute Deviation

- Similarity indicators
 - Correlation analysis (Pearson)
 - Non-parametric correlation analysis
 - Spearman
 - Kendall's tau
 - Mann-Whitney U
 - T-Test

"Geospatial Information for a Smarter Life and Environmental Resilience"

Materials & Methods "Usefulness" indicators

| Category of accuracy | Standards |
|----------------------|---------------------|
| Rough Leveling | Statutory Criterion |
| Ordinary Leveling | Statutory Criterion |
| Accurate Leveling | Statutory Criterion |
| Precise Leveling | Statutory Criterion |

RESULTS & OBSERVATIONS

Both heights show some level of similarity:

•They both report slightly varying range, mean, minimum & maximum height value

One may (at this point), want to conclude that clear distinction exist between the two elevations

| | Ν | Range | Minimum | Maximum | Mean | Std. Deviati on |
|-----------------------------------|-----|--------|---------|---------|--------------|-----------------------|
| Total Station Height (m) | 412 | 15.295 | 70.687 | 85.982 | 78.6707 5 | 5.15221 5 |
| Google Earth Height | 412 | 17 | 72 | 89 | 80.318 | 4.5646 |

"Geospatial Information for a Smarter Life and Environmental Resilience"

RESULTS & OBSERVATIONS (Cont'd)

The table shows the descriptive statistics of the results from the basic comparison between height from G.E. and Total station.

In general it can be said that G.E. data overestimates the topography of the profile by an average and maximum value of 1.65m and 8.89m respectively.

The positive mean error value indicates that majority of the errors are greater than zero. (supported by MAD Value "immune" to extreme values)

Therefore G.E. height values may be said to be positively biased along the profile path.

| DESCRIPTIVE STATISTICS | VALUE |
|------------------------------|--------|
| Mean | 1.6472 |
| Std. Error of Mean | 0.1116 |
| Median | 1.5925 |
| Std. Deviation | 2.2661 |
| Minimum | -5.295 |
| Maximum | 8.888 |
| RMSE | 2.7993 |
| Median Absolute Deviation | 1.7155 |

HE SCIENCE OF WHER

"Geospatial Information for a Smarter Life and Environmental Resilience"

RESULTS & OBSERVATIONS (Cont'd)

Questions by users:

•How much similarity exists between the two datasets?

•How significant is this similarity

Pearson's value of 0.899 @ 0.01 level of significance indicates existence of a significant positive relationship

Kendall's tau and Spearman's rho; respective values of 0.705 and 0.878(@ 0.01 level of significance), indicate a significant relationship between datasets

| Total Station Vs Go Val | e e e e e e e e e e e e e e e e e e e |
|----------------------------|---------------------------------------|
| Parametric | |
| Test | Value @ 0.01 level of significance |
| Pearson's | 0.889 |
| Non-Parametric | |
| Test | Value @ 0.01 level of significance |
| Kendall's Tau | 0.705 |
| Spearman's rho | 0.878 |
| | |

HE SCIENCE OF WHERE

"Geospatial Information for a Smarter Life and Environmental Resilience"

RESULTS & OBSERVATIONS (Cont'd)

Judging by ρ (Sig) value, It is safe to state that *a statistically significant difference exist between the two datasets*

| Total Station Height Value Vs Google Earth Height Value | | | | | | | | |
|--|---------------|--|--|--|--|--|--|--|
| Assumption of Normal D | istribution | | | | | | | |
| Test | ρ (Sig) value | | | | | | | |
| t-Test for Equality of Means | 0.000 | | | | | | | |
| Without Assumption of Normal Distribution | | | | | | | | |
| Test | ρ (Sig) value | | | | | | | |
| Mann-Whitney U | 0.000 | | | | | | | |

Implication/Usefulness based on Inherent error

| Different categories of accuracy for levelling operation | | | | | | | | | | | | | |
|--|----------------|----------|----------|----------|--------|--------|--|--|--|--|--|--|--|
| | Rough Leveling | Ordinary | Accurate | Precise | Total | Length | | | | | | | |
| | | Leveling | Leveling | Leveling | (km) | | | | | | | | |
| Constant value | 0.1 | 0.024 | 0.01 | 0.005 | 10.125 | | | | | | | | |
| Accuracy (m) | 0.318 | 0.076 | 0.032 | 0.016 | | | | | | | | | |

Judging by the Mean Error and RMSE value of 1.65m and 2.79m (table 3.0) of the dataset, the G.E. height cannot be used as a sufficient replacement of heights obtained by conventional levelling method

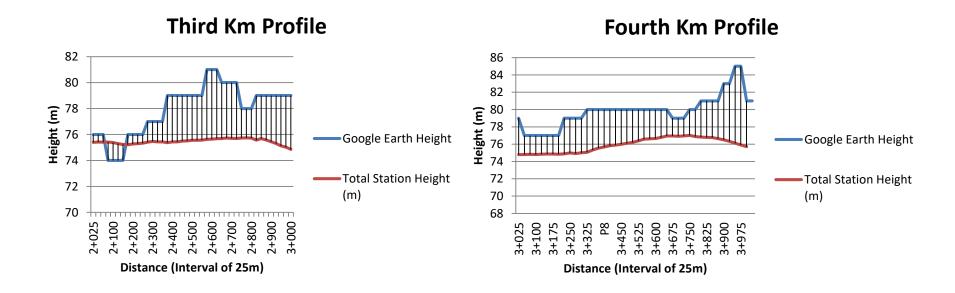

"Geospatial Information for a Smarter Life and Environmental Resilience"

Profiles

CONCLUSION

- Datasets look similar: "Prima Facie"
- But significantly different from the perspective of "Robust & Rigorous" statistics
- G. E. height data *failed to meet minimum standard* for levelling data
 - Therefore, *cannot and should not* be used for planning and executing serious engineering projects, particularly within study area (Aba).
